[50431] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 7080 (GAM7080), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[50432] GAM7080 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM7080 was detected is described hereinabove with reference to Figs. 8-15.

[50433] GAM7080 gene, herein designated GAM GENE, and GAM7080 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[50434] GAM7080 gene encodes a GAM7080 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM7080 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7080 precursor RNA is designated SEQ ID:183, and is provided hereinbelow with reference to the sequence listing part.

[50435] GAM7080 precursor RNA folds onto itself, forming GAM7080 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50436] GAM7080 precursor RNA folds onto itself, forming GAM7080 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[50437] Nucleotide sequence of GAM7080 precursor RNA, designated SEQ-ID: 183, and a schematic representation of a predicted secondary folding of GAM7080 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[50438] An enzyme complex designated DICER COMPLEX, `dices` the GAM7080 folded precursor RNA into GAM7080 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM7080 RNA is designated SEQ ID:399, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[50439] GAM7080 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM7080 target RNA, herein designated GAM TARGET RNA. GAM7080

target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[50440] GAM7080 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7080 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7080 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting. GAM7080 RNA may have a different number of target binding sites in untranslated regions of a GAM7080 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3'UTR region, this is meant as an example only. These target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[50441] The complementary binding of GAM7080 RNA, herein designated GAM RNA, to target binding sites on GAM7080 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7080 target RNA into GAM7080 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[50442] It is appreciated that GAM7080 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM7080 target genes. The mRNA of each one of this plurality of GAM7080 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7080 RNA, herein designated GAM RNA, and which when bound by GAM7080 RNA causes inhibition of translation of respective one or more GAM7080 target proteins.

[50443] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM7080 gene, herein designated GAM GENE, on one or more GAM7080 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the

background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50444] It is appreciated that specific functions and accordingly utilities of GAM7080 correlate with, and may be deduced from, the identity of the target genes which GAM7080 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50445]

[50902] Fig. 8 further provides a conceptual description of a novel

bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 7553 (GAM7553), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[50903] GAM7553 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM7553 was detected is described hereinabove with reference to Figs. 8-15.

[50904] GAM7553 gene, herein designated GAM GENE, and GAM7553 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[50905] GAM7553 gene encodes a GAM7553 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM7553 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7553 precursor RNA is designated SEQ ID:48, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:48 is located at position 26917454 relative to chromosome 7.

[50906] GAM7553 precursor RNA folds onto itself, forming GAM7553 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50907] GAM7553 precursor RNA folds onto itself, forming GAM7553 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[50908] Nucleotide sequence of GAM7553 precursor RNA, designated SEQ-ID: 48, and a schematic representation of a predicted secondary folding of GAM7553 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[50909] An enzyme complex designated DICER COMPLEX, `dices` the GAM7553 folded precursor RNA into GAM7553 RNA,

herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: A) nucleotide sequence of GAM7553 RNA is designated SEQ ID:354, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[50910] GAM7553 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM7553 target RNA, herein designated GAM TARGET RNA. GAM7553 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[50911] GAM7553 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7553 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7553 RNA is an accurate or a partial inversed-reversed se-

quence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting. GAM7553 RNA may have a different number of target binding sites in untranslated regions of a GAM7553 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3'UTR region, this is meant as an example only; these target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[50912] The complementary binding of GAM7553 RNA, herein designated GAM RNA, to target binding sites on GAM7553 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7553 target RNA into GAM7553 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[50913] It is appreciated that GAM7553 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM7553 target genes. The mRNA of each one of this

plurality of GAM7553 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7553 RNA, herein designated GAM RNA, and which when bound by GAM7553 RNA causes inhibition of translation of respective one or more GAM7553 target proteins.

[50914] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM7553 gene, herein designated GAM GENE, on one or more GAM7553 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50915] It is appreciated that specific functions and accordingly

utilities of GAM7553 correlate with, and may be deduced from, the identity of the target genes which GAM7553 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51243] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 7776 (GAM7776), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[51244] GAM7776 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM7776 was detected is described hereinabove with reference to Figs. 8–15.

[51245] GAM7776 gene, herein designated GAM GENE, and GAM7776 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[51246] GAM7776 gene encodes a GAM7776 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM7776 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7776 precursor RNA is designated SEQ ID:110, and is provided hereinbelow with reference to the sequence listing part.

[51247] GAM7776 precursor RNA folds onto itself, forming GAM7776 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional
`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[51248] GAM7776 precursor RNA folds onto itself, forming
GAM7776 folded precursor RNA, herein designated GAM
FOLDED PRECURSOR RNA, which has a two-dimensional
`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial reverse-complementary sequence of
the nucleotide sequence of the second half thereof.

[51249] Nucleotide sequence of GAM7776 precursor RNA, desig-
nated SEQ-ID: 110, and a schematic representation of a
predicted secondary folding of GAM7776 folded precursor
RNA are further described with reference to Table 2,
hereby incorporated by reference.

[51250] An enzyme complex designated DICER COMPLEX, `dices`
the GAM7776 folded precursor RNA into GAM7776 RNA,

herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM7776 RNA is designated SEQ ID:246, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[51251] GAM7776 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM7776 target RNA, herein designated GAM TARGET RNA. GAM7776 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51252] GAM7776 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7776 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7776 RNA is an accurate or a partial inversed-reversed se-

quence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting. GAM7776 RNA may have a different number of target binding sites in untranslated regions of a GAM7776 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3'UTR region, this is meant as an example only these target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[51253] The complementary binding of GAM7776 RNA, herein designated GAM RNA, to target binding sites on GAM7776 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7776 target RNA into GAM7776 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[51254] It is appreciated that GAM7776 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM7776 target genes. The mRNA of each one of this

plurality of GAM7776 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7776 RNA, herein designated GAM RNA, and which when bound by GAM7776 RNA causes inhibition of translation of respective one or more GAM7776 target proteins.

[51255] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM7776 gene, herein designated GAM GENE, on one or more GAM7776 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[51256] It is appreciated that specific functions and accordingly

utilities of GAM7776 correlate with, and may be deduced from, the identity of the target genes which GAM7776 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54374] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 7809 (GAM7809), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[54375] GAM7809 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM7809 was detected is described hereinabove with reference to Figs. 8–15.

[54376] GAM7809 gene, herein designated GAM GENE, and GAM7809 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[54377] GAM7809 gene encodes a GAM7809 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM7809

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7809 precursor RNA is designated SEQ ID:180, and is provided hereinbelow with reference to the sequence listing part.

[54378] GAM7809 precursor RNA folds onto itself, forming GAM7809 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
